

Biosimilar Monoclonal Antibodies

Human IgG based monoclonal antibodies (mAbs) are the fastest-growing category of therapeutics for cancer therapy. Several mechanisms of tumor cell killing by antibodies (mAbs) can be summarized as: direct action through receptor blockade or induction of apoptosis; immune-mediated cell killing by complement-dependent cytotoxicity (CDC), antibody-dependent cellular cytotoxicity (ADCC) or regulation of T cell function. Several monoclonal antibodies have received FDA approval for the treatment of a variety of solid tumors and hematological malignancies. BioVision is pleased to offer research grade biosimilars in human IgG format for your research needs. Our monoclonal antibodies are manufactured using recombinant technology with variable regions from the therapeutic antibody to achieve similar safety and efficacy. These antibodies can be used as controls for preclinical lead identification and potency assays for the development of novel therapeutics.
